To whom it may concern,

A two-story design was implemented in the past in Israel. However it was performed with previous generation equipment that allowed that (lower weight due to lower power density, lesser ventilation requirements), and nonetheless – it created significant structural and cooling challenges.

For **future** projects we **do not approve 2-story installation design** due to several factors:

1. The 2-story design isn't available in the Power Titan G2 that is planned to replace the current model in 2024. This is due to the entirety of the top side of the G2 being used for heat dissipation/fire blowout panels.
2. We do not allow installation of G2 modules on anything but solid ground due to significant weight and mechanical stress (46T per 20ft container).

Respectfully,

Aviram Ostrovsky
Delegated Solutions Manager
